

A Challenge by
Softworks × AISprint

GET TO KNOW [US] FIRST

we are a software studio that designs and builds full-scale digital products and system infrastructure across multiple industries.

we go as deep as the project needs, whether that's a full platform from scratch, or systems where hardware and software must work together.

this challenge comes straight from something we deal with in our own work every week.

@ softworks.studio

HERE'S THE [PROBLEM]

every project we take on starts the same broken way. **YIKES**

a client sends a voice note, three whatsapp messages, a screenshot with an arrow drawn on it, and an email from two weeks ago. **GAH NO!**

and somewhere in all of that is what they actually want. we then have to sit down, piece it all together, figure out what's missing, and write the brief ourselves from scratch. **UGH.**

this happens every single day. not just to us but to every studio, agency, and freelancer out there. **SHAME!!**

the tools people use weren't built for this so everyone just... deals with it. **UNFORTUNATELY**

nobody has actually solved this well yet. that's where you come in. **LUCKILY...**

WHAT WE WANT [YOU] TO [BUILD]

[1]

we want you to build a web app that takes:

messy, unstructured client input, text dumps, voice notes, screenshots, or all three at once,

and uses ai to spit out a clean, structured project brief.

no manual work, no guessing, no back and forth.

[2]

once the brief is ready, it gets sent to the client through a unique link.

they open it, read it, and confirm.

no account needed on their end, no friction, just clarity.

[3]

one thing we want to be clear about, this is not a project management tool. just the intake and structuring layer, done really well. stay focused.

user input, pick at least one:

- free text or pasted messages
- voice note or audio upload that gets transcribed automatically
- screenshot or image upload that the ai reads and interprets

WHAT IT [NEEDS] TO DO

what the ai needs to produce:

- a plain-language summary of what the client actually wants
- goals and success criteria pulled from their input
- a list of things that are unclear or missing stuff that needs clarifying before any work starts
- suggested follow-up questions to send back to the client

the output:

- clean, readable, formatted brief
- shareable via a unique link the client can open and confirm without needing an account
- saved to a real database so the user can come back and access past briefs

WHAT [YOU'RE] SUBMITTING

we want a live, deployed web app with a real backend. not a prototype, something that actually runs :)

use whatever stack you're comfortable with and can confidently ship in a week. no restrictions.

we'll be looking at:

- does the ai output actually make sense for what was given to it?
- is the ambiguity detection genuinely useful or just noise?
- does the shareable link flow work properly start to finish?
- could a non-technical client open this and use it without help?
- is it live?

ONE LAST THING

a focused tool that does three things well will beat a bloated one that does ten things badly every single time. focus on the core features!!

[WE'RE AROUND]

we're always open to a conversation. whether it's about something you're building, an idea you want a second opinion on, or just wanting to connect with people doing this professionally in cairo. find us anytime.

zeyad mostafa — zeyad@softworks.studio
ahmed mostafa — ahmed@softworks.studio
general — hi@softworks.studio

good luck — we're genuinely excited to see what you build with this.
